Background

Efficient management of infrastructure has a direct impact on the bottom line.

Monitoring assets over multiple geographies and in remote areas can be challenging.

Fluxcon is able to offer a satellite-based telemetry product, which can be added to existing solutions thus creating a telemetry redundant link via satellite

Challenge

Existing solutions typically rely on the Mobile Network Operator's (MNO) infrastructure for connectivity.

If a network failure occurs, it may be dificult to monitor, manage and control assets.

Solution

Fluxcon's redundant satellite link, can be interfaced with existing infrastructure to increase link availability, allowing customers access to monitor, manage and control their assets, even when the primary communications link is down.

Business value is delivered by:

- Increasing uptimes,
- Higher asset utilization

Value proposition

- · Low power unit, with internal battery (option).
- · Innovative Technology.
- Remote operations, coverage of the entire African continent.
- To increase productivity while minimising cost, by increasing monitoring solution link availability.
- To monitor, manage and control infrastructure, in the event of primary communications network failure.

Typical Monitoring Solution
